Features include a new campaign, new maps, a new strike team, and more: Q: JS window.location not working from php page I have a link on a webpage that launches a js file (opened via ajax). In that js file, I have a statement: window.location = "test.php"; The test.php page is accessed by the same page. The js file is located at the very bottom of the page. The problem is, once the js file is loaded, the page redirects to test.php but does not navigate to the URL. It just stays on the current page, so if you clicked the link, you are still on the current page. Any ideas why this would not work? A: window.location is evaluated before the new URL is loaded, so it only works when the page has finished loading. That means, if the PHP file is loaded via Ajax, it won't work. You need to use Javascript's onclick attribute to make it work. Here is an example: onclick="window.location = 'test.php?'" Instead of window.location, you can also use window.open(). This invention relates to a utility knife and more particularly to a safety knife with a trigger lock. A utility knife is generally comprised of a blade or the like which is pivotally connected to a handle. The blade is usually retained by means of a friction lock, and the handle is usually retained by means of a grip or grip portion. The utility knife is a general purpose tool which is widely used in industry and in the home. Generally, the blade of a utility knife is retracted and maintained in an extended position by means of a friction lock. The utility knife may be used in cutting or scraping operations and may be used for household purposes. The utility knife is a dangerous tool, as the blade thereof may be easily broken and may easily be stolen. Furthermore, if the utility knife is in the extended position, then the blade may accidentally stab the user. With the development of modern technology, there are many devices which are comprised of many components and which are complicated to operate. Examples of such devices include garage door openers, remote controlled electrically powered lawn mowers, air-conditioning and heating systems, etc. There is a need for a safety knife which is simple to operate, safe to operate, and which is aesthetically pleasing. 82157476af
